## Contents

This document provides information about the (undocumented yet) format of custom shapes files in Photoshop.

**Note:** all multi-byte values, i.e., integer numbers (including C-style 4-character constants), fixed-point numbers, and Unicode characters are coded in [big-endian](#) format.

## Custom shapes file format

### Custom shapes file

Name	Type	Kind	Description
CustomShapes.psp	'8BPF'	Custom shapes file	Adobe Photoshop preferences file containing all the custom shapes listed in the Preset Manager. <b>Warning:</b> like most preferences files, the custom shapes file is not updated in real-time: it is read by the application only once at start-up (launch) time and written back at shut-down (quit) time.
*.csh	'8BCS'	Custom shapes file	Adobe Photoshop custom shapes file; generally produced by saving a selected set of custom shapes from the Preset Manager.

Length (in bytes)	Description	Comments
4	Magic number (= 'cush')	C-style 4-character constant.
4	Version (= 2)	32-bit integer.
4	Number of custom shapes	32-bit integer.
Variable	Sequence of custom shapes	Each in <a href="#">Custom shape</a> format.

### Custom shape

Length (in bytes)	Description	Comments
Variable	Custom shape name	<a href="#">Unicode string</a> format.
0 or 2	Extra null padding	Only if length of previous Unicode string is odd.
4	Unknown (= 1)	32-bit integer.
4	Length (in bytes) of remaining custom shape data	32-bit integer.

1 + 36	Custom shape ID (UUID)	Pascal-style string format.
16	Reference bounds for anchor and control points	Bounds rectangle format.
Variable	Sequence of path records	Each in Path record format.
1 or 3	Extra null padding	To match the above length of remaining custom shape data (always a multiple of 4).

## Unicode string

Length (in bytes)	Description	Comments
4	Number of Unicode characters	32-bit integer.
Variable	String of Unicode characters	Two bytes per character; includes terminating null.

## Pascal-style string

Length (in bytes)	Description	Comments
1	Number of characters	8-bit integer (unsigned).
Variable	String of characters	One byte per character; no terminating null.

## Bounds rectangle

Length (in bytes)	Description	Comments
4	Top coordinate (in pixels)	32-bit integer (signed).
4	Left coordinate (in pixels)	32-bit integer (signed).
4	Bottom coordinate (in pixels)	32-bit integer (signed).
4	Right coordinate (in pixels)	32-bit integer (signed).

## Path record

Length (in bytes)	Description	Comments
2	Selector	16-bit integer: <ul style="list-style-type: none"> <li>• 0 (closed subpath length record)</li> <li>• 1 (closed subpath Bezier knot, linked)</li> <li>• 2 (closed subpath Bezier knot, unlinked)</li> <li>• 3 (open subpath length record)</li> <li>• 4 (open subpath Bezier knot, linked)</li> <li>• 5 (open subpath Bezier knot, unlinked)</li> <li>• 6 (path fill rule record)</li> <li>• 7 (clipboard record)</li> <li>• 8 (initial fill rule record)</li> </ul>
24	Path record data	Depending on selector: <ul style="list-style-type: none"> <li>• Subpath length record format</li> <li>• Subpath Bezier knot format</li> <li>• Subpath Bezier knot format</li> <li>• Subpath length record format</li> <li>• Subpath Bezier knot format</li> <li>• Subpath Bezier knot format</li> <li>• Path fill rule record format</li> <li>• Clipboard record format (not used)</li> <li>• Initial fill rule record format</li> </ul>

Cf. [Path resource format](#) of the page [Adobe Photoshop File Formats Specification](#) for more details about the way paths are stored in a Photoshop document.

## Path fill rule record

Length (in bytes)	Description	Comments
24	Unused	Should be zeroes.

## Initial fill rule record

Length (in bytes)	Description	Comments
2	Initial fill (= 0)	16-bit integer (unsigned); should be 0 or 1 (fill starts with all pixels); not used.
22	Unused	Should be zeroes.

## Subpath length record

Length (in bytes)	Description	Comments
2	Subpath length (number of Bezier knots)	16-bit integer (unsigned).
22	Unused	Should be zeroes.

## Subpath Bezier knot

Length (in bytes)	Description	Comments
8	Backward control point for the Bezier segment preceding the knot	<a href="#">Path point</a> format.
8	Anchor point for the knot	<a href="#">Path point</a> format.
8	Forward control point for the Bezier segment leaving the knot	<a href="#">Path point</a> format.

Cf. [Bezier curves](#).

## Path point

Length (in bytes)	Description	Comments
4	Vertical component	32-bit fixed-point number (signed), in <a href="#">Q8.24</a> format.
4	Horizontal component	32-bit fixed-point number (signed), in <a href="#">Q8.24</a> format.

[Fixed-point numbers](#) are implemented here as 32-bit integers, with 8 bits before the binary point and 24 bits after the binary point. In JavaScript, since all numbers are represented as floating-point numbers, appropriate values are simply obtained by dividing the extracted 32-bit signed integer values by  $0x1000000$  ( $2^{24}$ ).

The resulting horizontal and vertical component values of a path point always fall between 0.0 and 1.0 (both exclusive).  $[0.0, 0.0]$  and  $[1.0, 1.0]$  correspond respectively to the top-left and bottom-right corners of the bounds rectangle, which appears to have an extra "safety" margin of 1 pixel in each direction (i.e.: top, left, bottom, right).

## Path records order

For each custom shape, the first path record is always a "path fill rule record" (selector: 6), immediately followed by an "initial fill rule record" (selector: 8), whose initial fill value (0 or 1) is apparently not used.

Then, for each subpath:

- a "closed subpath length record" (selector: 0) is followed by a sequence of either "closed subpath Bezier knot, linked" (selector: 1) or "closed subpath Bezier knot, unlinked" (selector: 2),

or

- an "open subpath length record" (selector: 3) is followed by a sequence of either "open subpath Bezier knot, linked" (selector: 4) or "open subpath Bezier knot, unlinked" (selector: 5).

# Parsing custom shapes files

A practical set of JavaScript functions for parsing custom shapes files is contained in the module [jamShapes](#), which is part of the [JSON Action Manager](#) scripting library. It is used by the following utility scripts:

- [Convert Custom Shapes File to SVG Set](#): [Photoshop CS3 or later] convert a custom shapes file (.csh) or a custom shapes preferences file (CustomShapes.psp) into a set of SVG files.
- [Insert Custom Shape Path](#): [Photoshop CS3 or later] create a work path from a custom shape contained in a custom shapes file (.csh).
- [Parse Custom Shapes File](#): [Photoshop CS3 or later] parse a custom shapes file (.csh) or a custom shapes preferences file (CustomShapes.psp) into a JSON text file.
- [Preview Custom Shapes File](#): [Photoshop CS3 or later] graphically preview a custom shapes file (.csh) or a custom shapes preferences file (CustomShapes.psp) in a new image document.

All files are open-source and licensed under [GPLv3](#); the utility scripts have been successfully tested in Photoshop CS4 on Mac OS X, but should be platform agnostic.
